

Front-end development: DOM

JavaScript – forEachDOM

The following exercise contains the following subjects:

- DOM
- foreach

Instructions

You get an array of objects of users from your database:

```
const users = [  
  {  
    id: 167464,  
    firstName: "Jimmy",  
    lastName: "Arnold",  
    email: "jimmya@gmail.com",  
  },  
  {  
    id: 578447,  
    firstName: "Martha",  
    lastName: "Goldman",  
    email: "gold@hotmail.com",  
  },  
  {  
    id: 864578,  
    firstName: "Tim",  
    lastName: "Burton",  
    email: "timmy.hotmail.com",  
  },  
];
```

1. Loop over the array with the `forEach` method and dynamically create an ordered list of the first and last names of the objects.
2. Remove the bullet points of the ordered list with JavaScript.
3. Create a custom data attribute called “data-id” and attach the id value to each li.

Your markup should look like this:

```
▼<ol style="list-style-type: none;">
  <li data-id="167464">Jimmy Arnold</li> ==
  <li data-id="578447">Martha Goldman</li>
  <li data-id="864578">Tim Burton</li>
</ol>
</div>
```
