Front-end development: Basics

JavaScript – Basketball score

The following exercise contains the following subjects:

- Order Of Operation
- If statements

Instructions

John and Mike both play basketball on different teams. In the latest 3 games, John's team scored 89, 120, and 103 points, while Mike's team scored 116, 94, and 123 points.

1. Calculate the average score for each team.
2. Decide which team wins on average (highest average score), and print the winner to the console. Also include the average score in the output.
3. Then change the scores to show different winners. Don't forget to take into account that there might be a draw (the same average score).
4. EXTRA: Mary also plays basketball, and her team scored 97, 134, and 105 points. Like before, log the average winner to the console.
5. Like before, change the scores to generate different winners, keeping in mind there might be draws.
